Acronym The name AutoCAD was devised from three letters chosen by the founders of the company: "automatic" and "computer" and "draftsman". History AutoCAD was started in 1980 by a group of software programmers at DEC who had formerly worked for Avtec Software and then Dialog. The initial goal was to automate work performed by draftsmen on large-scale architectural projects. As the first commercial program of this kind, AutoCAD was released in December 1982 for personal computer systems with their graphics terminals, and subsequently became available for mainframe and minicomputer systems. The first version of AutoCAD was only a few hundred lines of code and did not use a standardized programming language. Rather, it was a set of instructions that could be used to drive a graphics terminal. However, for the next three years, the entire project was steered by David Unger, a draftsman who had programmed his own drafting programs. AutoCAD version 1.0 was released in 1984. Early development The original AutoCAD architecture was fairly complicated, with a number of separate interfaces and input screens, as well as a large proportion of code dedicated to saving and loading the screen image from the graphics terminal. However, the code quickly became unwieldy, and many problems occurred. Unger explained: In order to address the problems, Unger left the project, handing it over to John Walker and Elmer Krum. AutoCAD version 1.5 was released in 1985. The system was re-written in assembler language in order to reduce the number of lines of code and facilitate debugging. The program became larger and was no longer able to fit on floppy disks. Due to this limitation, it was renamed AutoCAD LT. An early version of the AutoCAD system was first installed and used by a draftsman, Paul Slifka, at Transit Systems in Toronto. Slifka liked what he saw, and urged his bosses to buy a license for AutoCAD, which was eventually done. Development continued during the early years of Microsoft. In 1987, Paul Kaczmarek was hired as a product manager at Autodesk, and in 1989 became the vice president of the company's Personal Products Division. He was instrumental in many early decisions, including the choice of the name "AutoCAD" and the decision to pursue Microsoft Windows as a platform for the program.

Extensible Faxes (eFaxes), a discontinued project from Autodesk. The original technology was developed by Sang and conceived by Philip Jeh in 1987 at PARC, and created by Sang and Jon P. Reinders at Autodesk in the early 1990s. It is a library and programming language for sending faxes from one computer to another through a software middleware. eFax was initially integrated with AutoCAD Download With Full Crack and later migrated to stand-alone software. In 2011, the eFax technology is being used in the AVON software from AutoDesk.
